

# ChatGPT Usage Transparency

ChatGPT was used as a **support tool** during the development of this project to:

- discuss high-level architectural choices and design trade-offs.
- refine code structure and improve readability.
- Handling missed edge cases and understanding financial terms.
- assist in debugging and validating logic during development.

All **core implementation, system design decisions, analytics logic, and final code** were written and verified by me. ChatGPT was not used to generate the complete solution end-to-end, but rather as an aid for reasoning, review, and problem-solving.
